## **COMP3411/9414: Artificial Intelligence**

# **2c. Reactive Agents**

UNSW © Alan Blair, 2013-18

COMP3411/9414 19s1 Reactive Agents

# **Reactive Agents**

- choose the next action based only on what they currently perceive, using a "policy" or set of rules which are simple to apply
- unable to remember, plan or logically reason
- interesting behaviors can "emerge" from these simple rules

COMP3411/9414 19s1 Reactive Agents 1

### **Outline**

- History of Reactive Agents
- Braitenberg Vehicles
- Chemotaxis
- Behavior-Based Robotics

UNSW © Alan Blair, 2013-18

COMP3411/9414 19s1 Reactive Agents 3

# **History of Reactive Agents**

- 1948 Alan Turing (importance of embodiment)
- 1969 Herbert Simon (parable of ant on beach)
- 1984 Valentino Braitenberg (Vehicles)
- 1991 Rodney Brooks ("Intelligence without Reason")
- 1995 Lego MindStorms

COMP3411/9414 19s1 Reactive Agents 4 COMP3411/9414 19s1 Reactive Agents

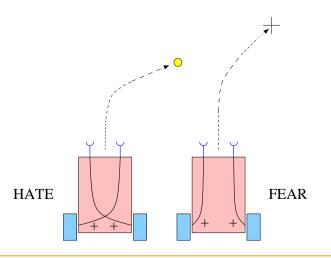

# **Braitenberg Vehicles**

- Braitenberg showed how simple arrangements of sensors and motors can lead to surprisingly sophisticated behavior
- simplest vehicles have two wheels and two sensors
- sensors respond to a light source
- response is inversely proportional to distance

UNSW © Alan Blair, 2013-18

COMP3411/9414 19s1 Reactive Agents

# **Braitenberg Vehicles**

# **Braitenberg Vehicles**

- connections can be
  - straight or crossed
  - ► excitatory (+) or inhibitory (−)
- leads to four behaviors
  - hate
  - fear
  - ▶ love
  - curiosity

## **Chemotaxis**

- Many single- and multi-cell organisms can direct their movement to swim to areas with higher (or lower) chemical concentration
- bacteria use flagella to propel themselves
  - ightharpoonup anti-clockwise rotation  $\rightarrow$  linear motion
  - ▶ clockwise rotation → tumbling motion

UNSW © Alan Blair, 2013-18

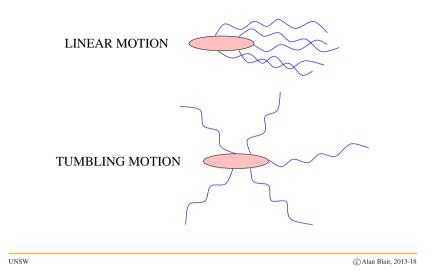

COMP3411/9414 19s1 Reactive Agents 10

## **Chemotaxis**

- normally, bacterium switches between linear and tumbling motion, producing a random walk
- if it senses that it is heading in the "right" direction, it will lengthen the current period of linear motion
- in this way, it can successfully move toward food sources and away from toxins

## **The Swiss Robots**

Reactive Agents

Q: What rules are these robots using to "clean up" the pucks?

## **Behaviour-Based Robotics**

Introduced by Rodney Brooks in the late 1980's as a challenge to "Good Old Fashioned AI" (GOFAI)

- robots should be based on insects rather than humans
- tasks like walking and avoiding obstacles rather than playing Chess
- abandon traditional horizontal decompositon
  - ightharpoonup Sense ightharpoonup Plan ightharpoonup Act
- replace with vertical decompositon or "subsumption architecture"
  - ▶ each layer can connect sensing right through to action

### **The Swiss Robots**

The rules used by the Didabots:

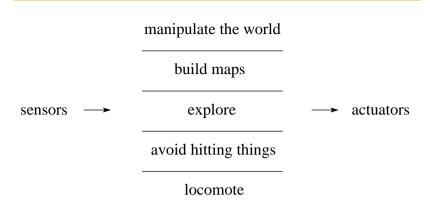

- normally, move forward
- if you detect an obstacle to the left or right, turn away from it
- if you detect an obstacle directly in front, move forward

15

## **Modern Perspective**

- Each layer in the vertical decomposition is a behavior
  - ▶ low-level behaviors like "avoid hitting things" are reactive, connecting sensors directly to actuators
  - ▶ mid-level behaviors like "build maps" make use of a world model
  - ▶ high-level behaviors make use of world model and planning
- higher level behavior may take control from lower-level behavior
  - ▶ e.g. if the low-level behavior has gotten "stuck"
- lower level behavior may take control from higher-level behavior
  - e.g. to avoid getting burned, or falling down a staircase
